TRANSPLANTONE

REDUCES LOSS IN TRANSPLANTING

REDUCES WILTING AND LOSS

PRODUCES EARLIER FLOWERS AND CROPS

When plants are moved or transplanted, many of the feeder roots are broken. The plant usually stops growing until it repairs or replaces these roots. Loss of water causes wilting. TRANSPLANTONE helps grow new roots and reduces loss of water so the plant starts growing again in a much shorter time.

General Directions

Mix a level teaspoonful of TRANSPLANTONE with one gallon of water for trees or shrubs. For seedlings or soft-tissued plants, use a teaspoonful of TRANSPLANTONE with ten gallons of water.

This solution is now ready for application to seedlings, small plants, or shrubs. Soak the roots in the solution for an hour before planting.

BETTER PASTURES FEED MORE CATTLE

THE FOLLOWING GRASSES FOR HAY OR PASTURE

REED'S CANARY GRASS—A perennial grass that will thrive in marshy places, stands under water for weeks without injury, yields enormous tonnage of hay with feed value equal to wheat bran. Sow any time before June 20th at the rate of 10 to 12 pounds per acre, broadcast. It forms a sod rapidly through the spreading of underground roots. Makes your lowlands grow profitable crops.

PERENNIAL RYE GRASS—A very valuable variety for permanent pasture. Succeeds well on almost any soil, but is particularly adapted to moderately moist or irrigated lands. Sow 20 to 30 pounds per acre in spring.

BROME GRASS (Bromus Inermis)—Yields enormous crops of splendid hay, and affords early and abundant pasture.

MEADOW FESCUE, or ENGLISH BLUE GRASS—Of great value for permanent pasture and for hay. Does best on irrigated land.

PERMANENT PASTURE MIXTURE—We highly recommend the following ratio for a well balanced permanent pasture mixture: 25% Orchard Grass; 30% Brome Grass; 20% Perennial Rye Grass; 17% Meadow Fescue and 8% Yellow Blossom Sweet Clover. Sow 25 to 30 pounds per acre. Sow broadcast, cover lightly and keep wet until well started.

ORCHARD GRASS—Often sown with Alfalfa to give a stronger and better hay. It will stand drought or will do well in the shade. Orchard Grass gives a heavy tonnage in permanent pasture, furnishes the first green bite in the Spring and the last in the Fall.

WESTERN WHEAT GRASS (Agropyron Smithii)—or Bluestem, is a long-lived perennial. Tolerant of drought and a certain amount of alkali. It grows rather slowly, requiring two to three years from time of planting to reseed. Western Wheat Grass produces excellent forage for grazing and hay.

TIMOTHY—Of hay grasses, Timothy leads all. Thrives on clay or heavy loams, wet or boggy soils, or in mountainous districts. At higher elevations where fewer grasses and clovers are adaptable, Timothy is the most important hay and pasture crop. Alone, sow 12 pounds to the acre, or with clover, 10 pounds Timothy and 6 pounds clover.

RED TOP—A valuable grass for moist soils. It makes a good permanent stand and is well adapted to pastures. It has been grown very successfully even on alkali and bottom land where many other grasses have failed. It is used also as a lawn grass as it makes a fine stem and good turf. Sow 15-25 pounds per acre.

DOMESTIC RYE—Valuable as a nurse crop for slow starting grasses. Also makes a good pasture same year seed is sown. Not entirely hardy but will live several years during mild winters.

SUDAN GRASS—One of the best catch crops to plant when late seeding is necessary. Can be cut every six weeks until frost. Frost kills it entirely. A real drought resister, renewing its growth immediately when rain comes. An enormous hay yielder and the hay can be fed in unlimited quantities without any danger to stock.

SEE YELLOW PRICE SHEET FOR PRICES ON ALL THE ABOVE AND OTHER VARIETIES AND KINDS OF SEED

If the above grasses or mixtures are not suited to your needs please write us describing your soil and climatic conditions—perhaps we can help you. Special mixtures will be made to suit you.

Quality is protected on all these seeds by the MILE HIGH Brand. Perhaps you are familiar with our High Altitude Grown Seeds and know the results that can be expected from them.

CYCLONE SEED SOWER

The finest hand seeder known. Throws seed directly and evenly on the land. Can be set to sow any amount desired. Sows alfalfa, clover, grass or small grains very satisfactorily.

Price each, \$3.25 postpaid.

“MILE HIGH” PEAK OF QUALITY WESTERN COLORADO GROWN

HARDY STRAINS ALFALFA AND CLOVER

LADAK. A wilt-resistant variety, is slow to start in the spring, but it resists drought and produces a good yield of hay. Leafy and of high feeding value, and will hold a stand longer than other varieties.

COMMON. Deep-rooted Excellent for hay; but must have a deep soil. Therefore, if you do not have over two and a half feet of good soil to water, shale, or gravel, we suggest that you use Grimm.

GRIMM. Has a spreading root and lives from surface soil. Will withstand severe freezing; does not winter kill; better adapted to extreme northern and high altitude.

MEEKER BALTIC. A distinct variety; same root system as the Grimm. Originated at Meeker, Colorado, on dry land. Withstands severe winters.

STRAWBERRY CLOVER. Western Colorado grown seed. It thrives on wet, seepy soil, even though there is a lot of alkali. Best suited for pasture; spreads from root and seed—a perennial plant. Requires 3 lbs. of seed per acre. For best results, sow in rows with garden seed planter, if possible.

MEDIUM RED CLOVER—A biennial plant growing 16 to 18 inches high; fine for hay and pasture; good producer of nitrogen.

MAMMOTH RED CLOVER—A biennial larger and coarser than Medium Red; a better soil builder and also a good hay.

HUBAM SWEET CLOVER—An annual rapid growth, coarse and fibery; develops rapidly and produces seed the first year; for soil building or cover crop.

YELLOW BLOSSOM SWEET CLOVER—A biennial for hay and pasture; also a very good cover crop and soil builder.

WHITE BLOSSOM SWEET CLOVER—A biennial coarser than Yellow Blossom; a good cover crop; not as good for hay or pasture.

LADINO CLOVER—A long-lived perennial. Its growth is large and luxuriant. When the leaf growth has been grazed off, new leaves develop quickly, complete recovery occurring in 17 to 28 days. It is strictly a crop for irrigation. Sow in Fall or Spring at the rate of 4 to 6 lbs. per acre.

ALSIKE CLOVER—Especially valuable for growing with timothy in high altitudes. Hardy and withstands wet ground.

REMEMBER ALWAYS: INOCULATE YOUR LEGUME SEEDS EVEN THOUGH PLANTED ON FIELDS THAT HAVE BEEN INOCULATED BEFORE. Field tests have shown that better crops are harvested when Legume seeds are inoculated even when planted on fields where inoculated seeds of the same Legume crops had grown the previous year. It seldom pays to depend upon natural inoculation.

IMPORTANT—When Ordering Always State Name of Seed or Give Culture Group Letter.
